

# The path to modern logging, monitoring, and alerting in GARR

FABIO FARINA, GIANNI MARZULLI - GARR

GN4-3 Telemetry workshop - 10/11/2020

Contact: [fabio.farina@garr.it](mailto:fabio.farina@garr.it)

# Outline

---

*"When you cannot measure it,  
your knowledge is of a meagre and unsatisfactory kind"*  
Lord William Thomson Kelvin

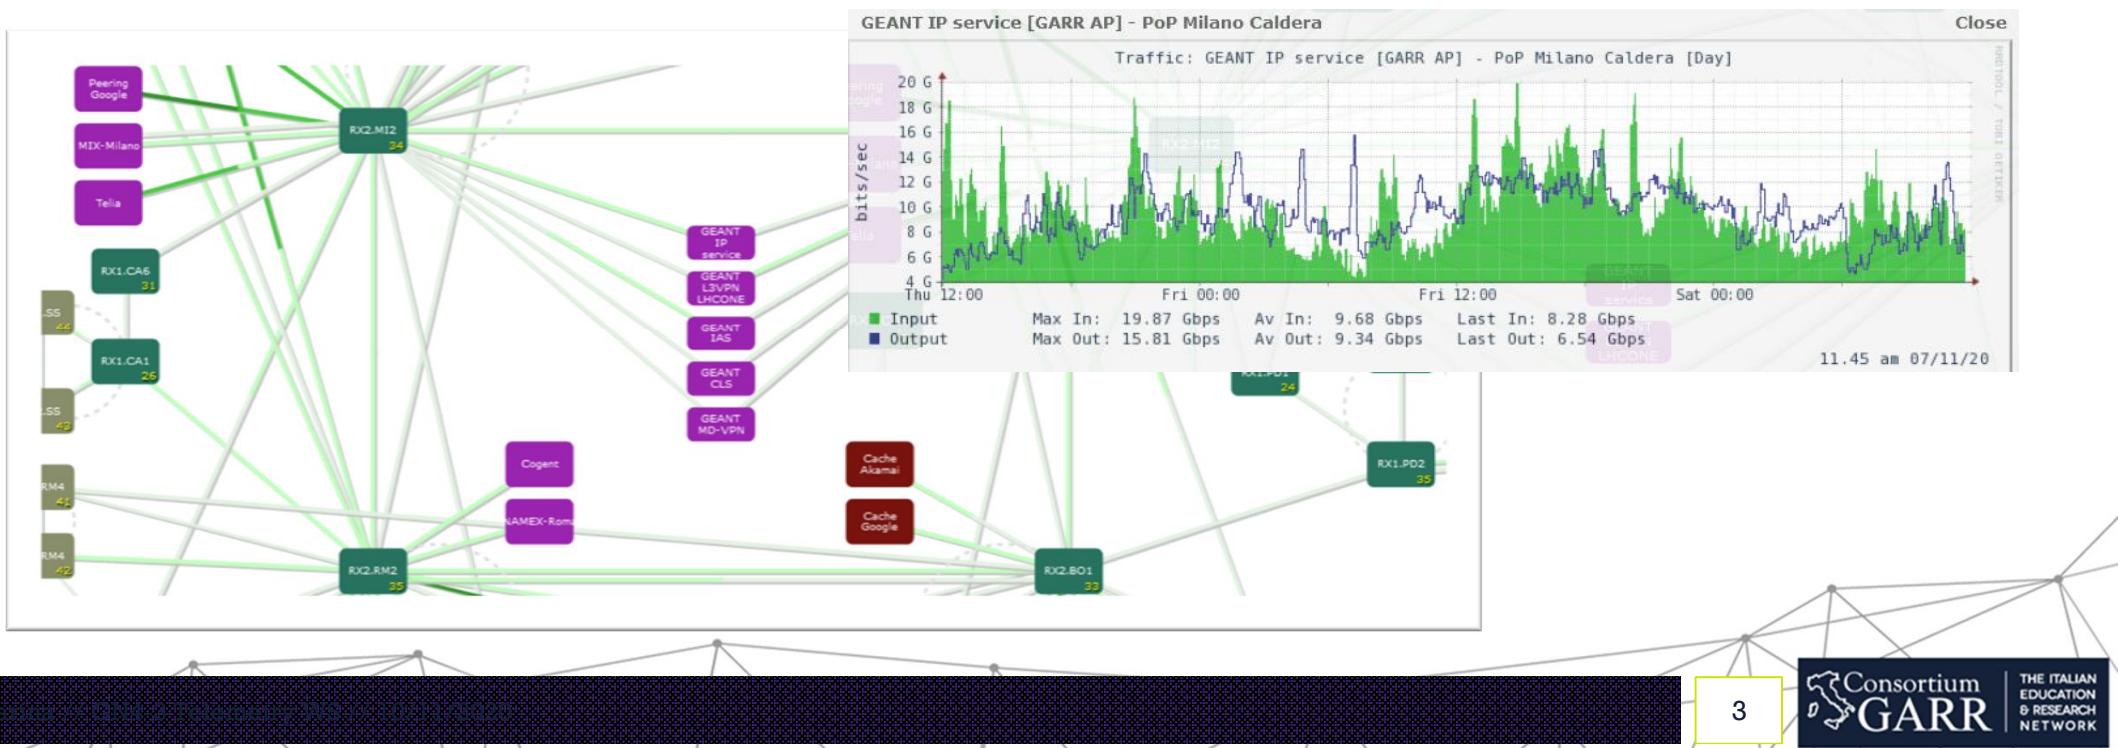

## Overview on telemetry usage at GARR

- > A brief history
- > Current model, tools and strategy
- > Future directions

# Once upon a time

Since the beginning

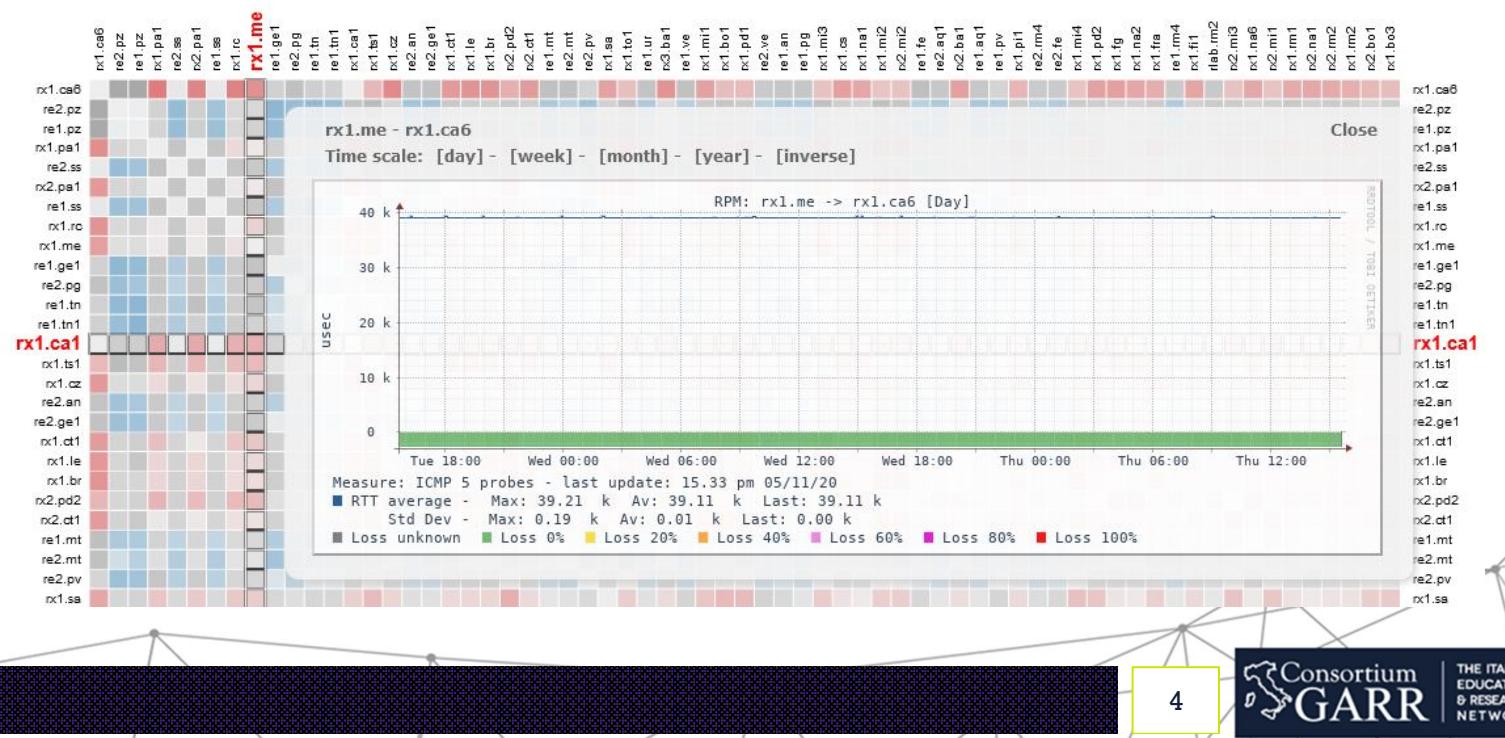

- > GINS monitoring system
- > ad hoc GARR custom development
- > weather maps, RRD, SNMP, counters

# Once upon a time

~2017 – Early days

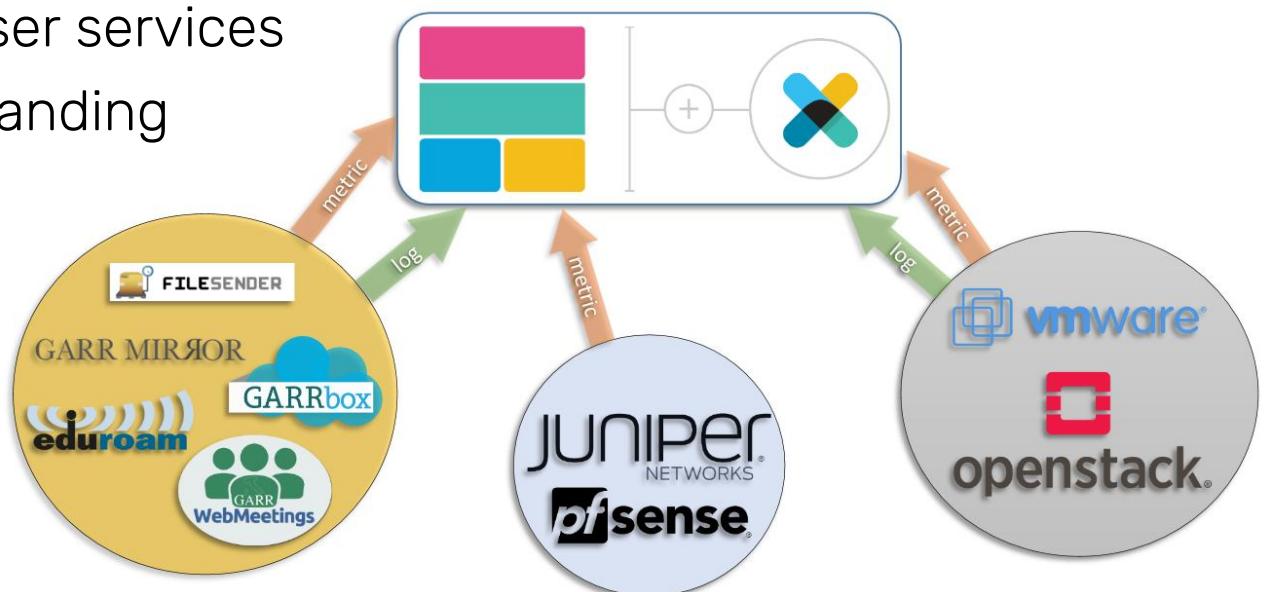

- > Juniper RPM for RTT monitoring
  - > InfluxDB & custom visualization

# Time goes by

2018 – Elastic.com PoC

- > Log centralization exercise
- > DC, network & end-user services
- > Learning and understanding

Till more recent time

---

Late 2018 – Set mid-term goals

- > Transition to production
- > Standardize monitoring tools and processes
- > Harmonize with GARR automation methodology

2019 – Backbone central logging facility

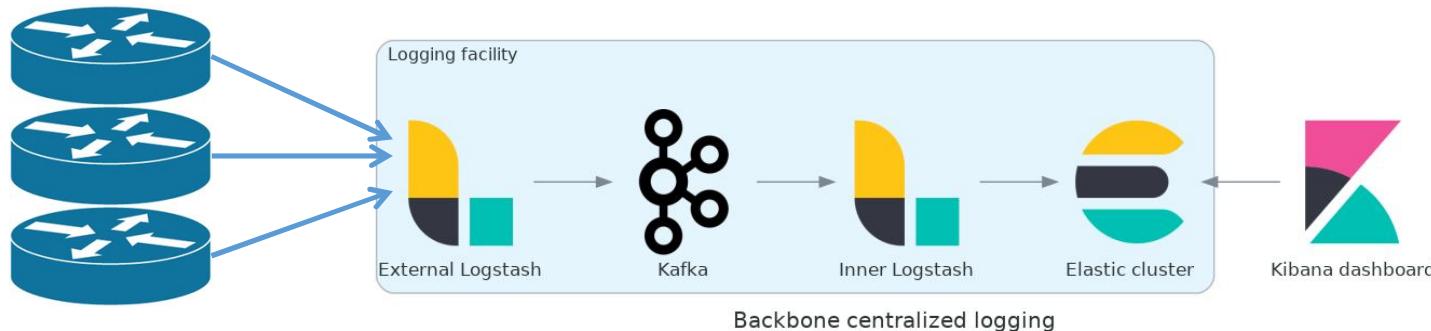

2020 – Telemetry model and tools consolidation

GARR MIRROR

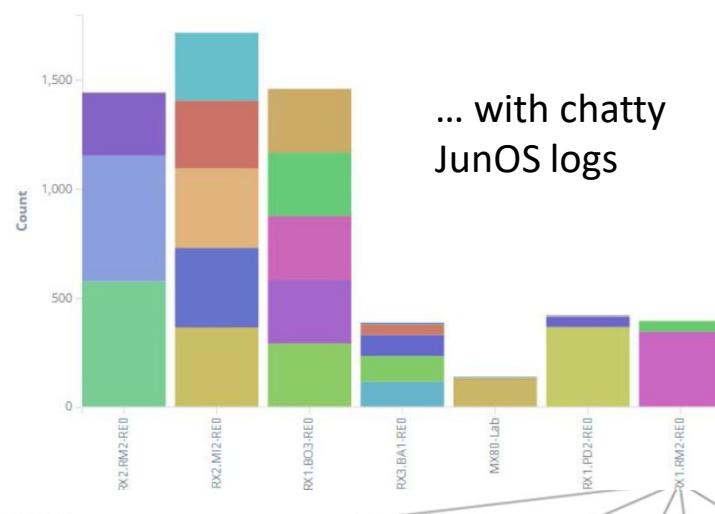

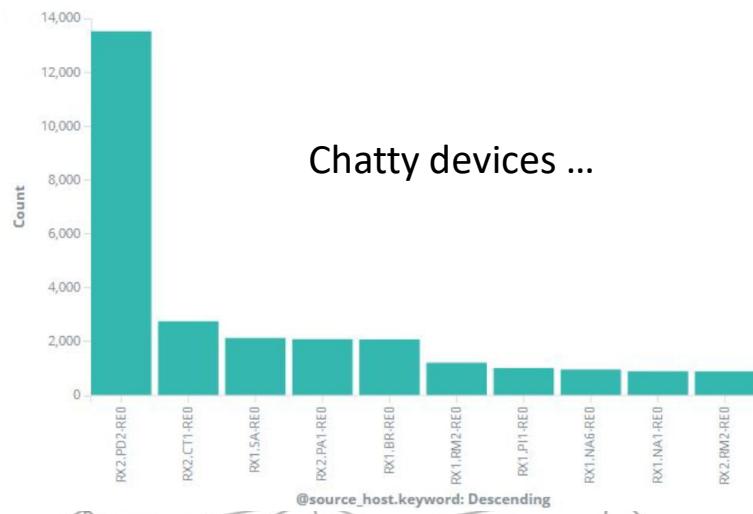

# Backbone routers logging facility

«No garbage in!»

4 hours to setup the platform, 2 weeks to clean up the data (mid July 2019)

# Backbone logging

Whole network daily index size after data pipeline optimization

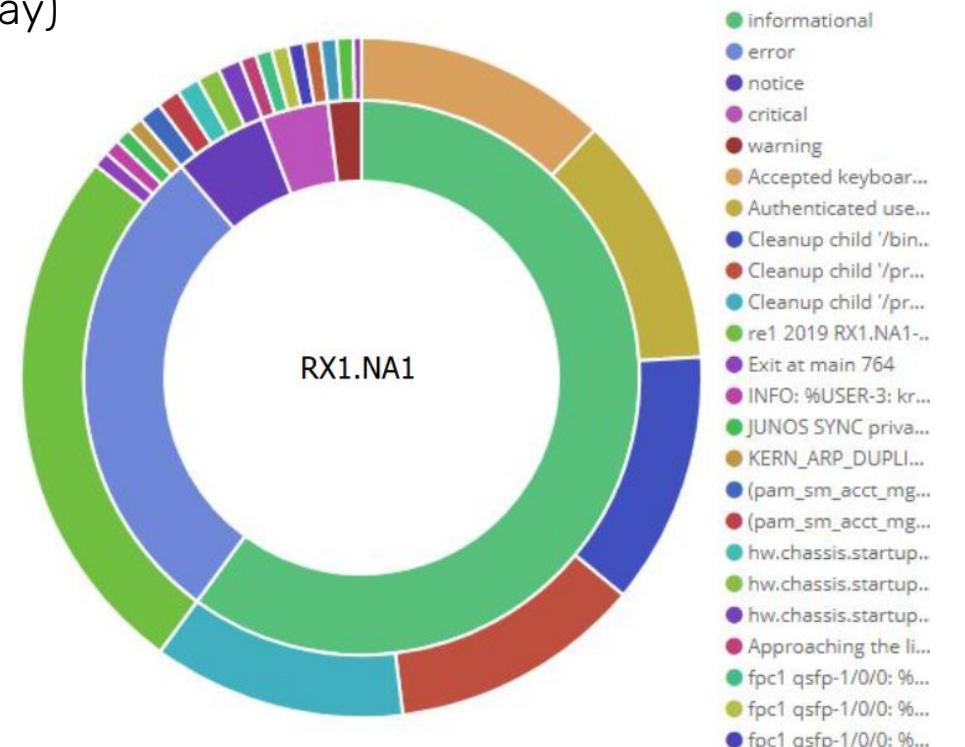

- > from 200 MB/day to 60 MB/day (80 kEvents/day)

Usage from the network operations

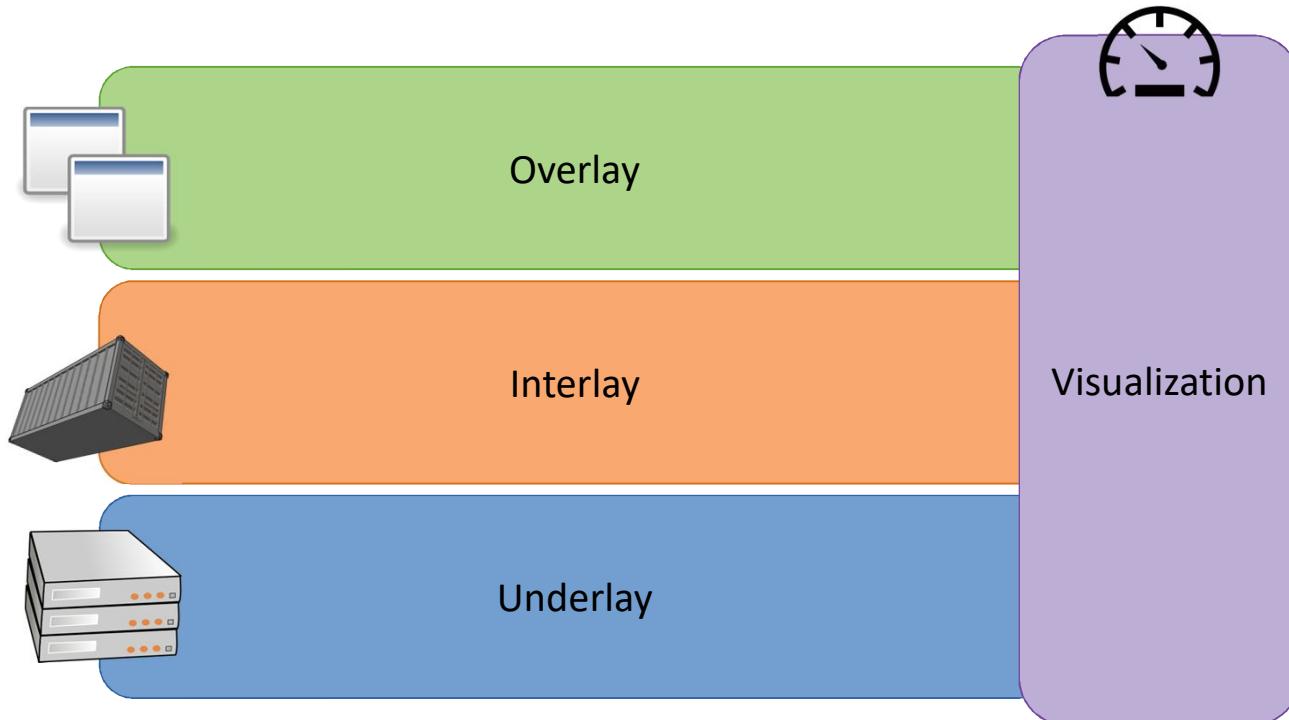

- > check faults and misbehavior
- > track BGP sessions changes
- > check CLI/SSH access on the routers
- > simpler log exchange with Juniper support
- > events clustering by severity / by roles

More recent changes

- > Cisco CPEs log collection
- > Alerting (more later...)

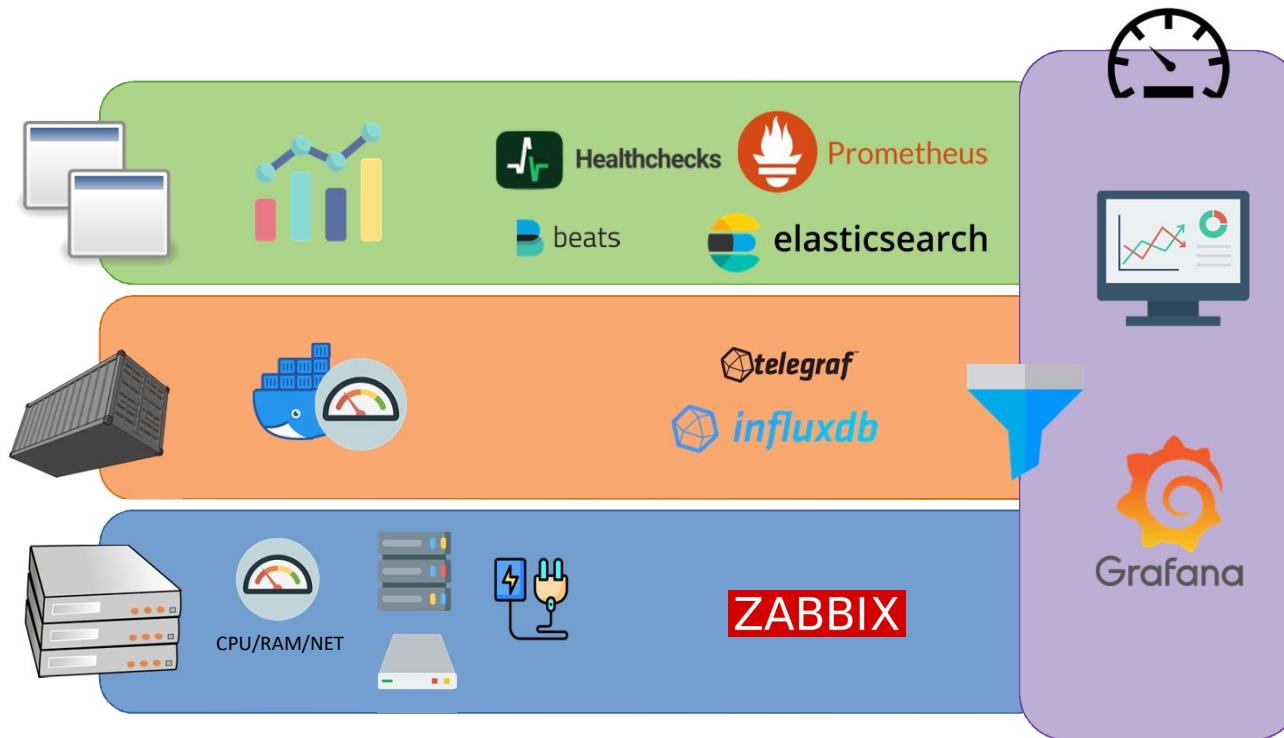

# Data collection and presentation

Collection layered model

« You cannot measure blood pressure with a thermometer »

# Toolset: data lakes and probes

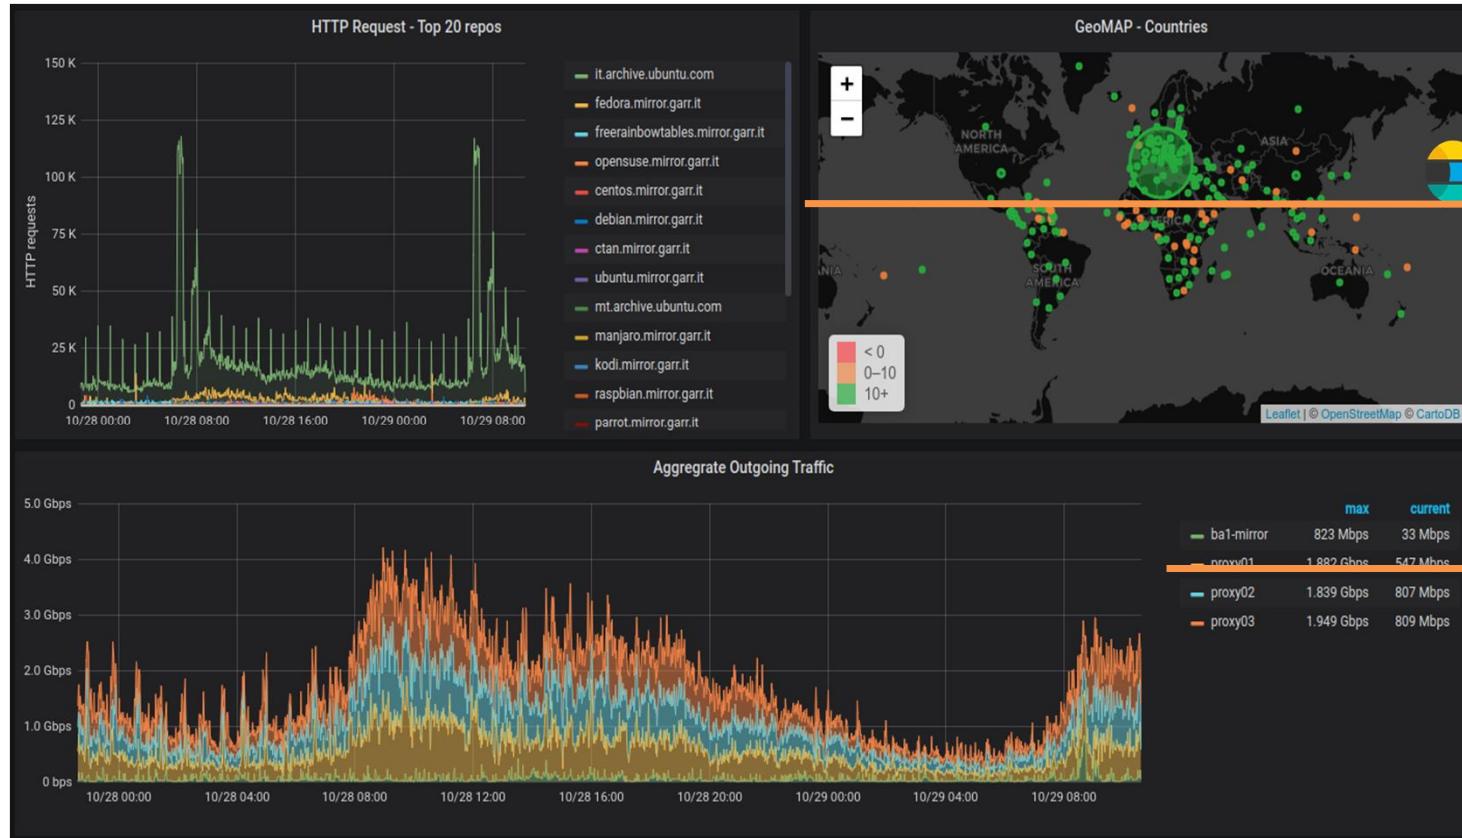

Automation tools

> **Data lakes**  
Kubernetes  
Helm packages

> **Probes**  
Ansible roles  
Docker containers

# A vertical view - GARR Mirror

Service Operation perspective

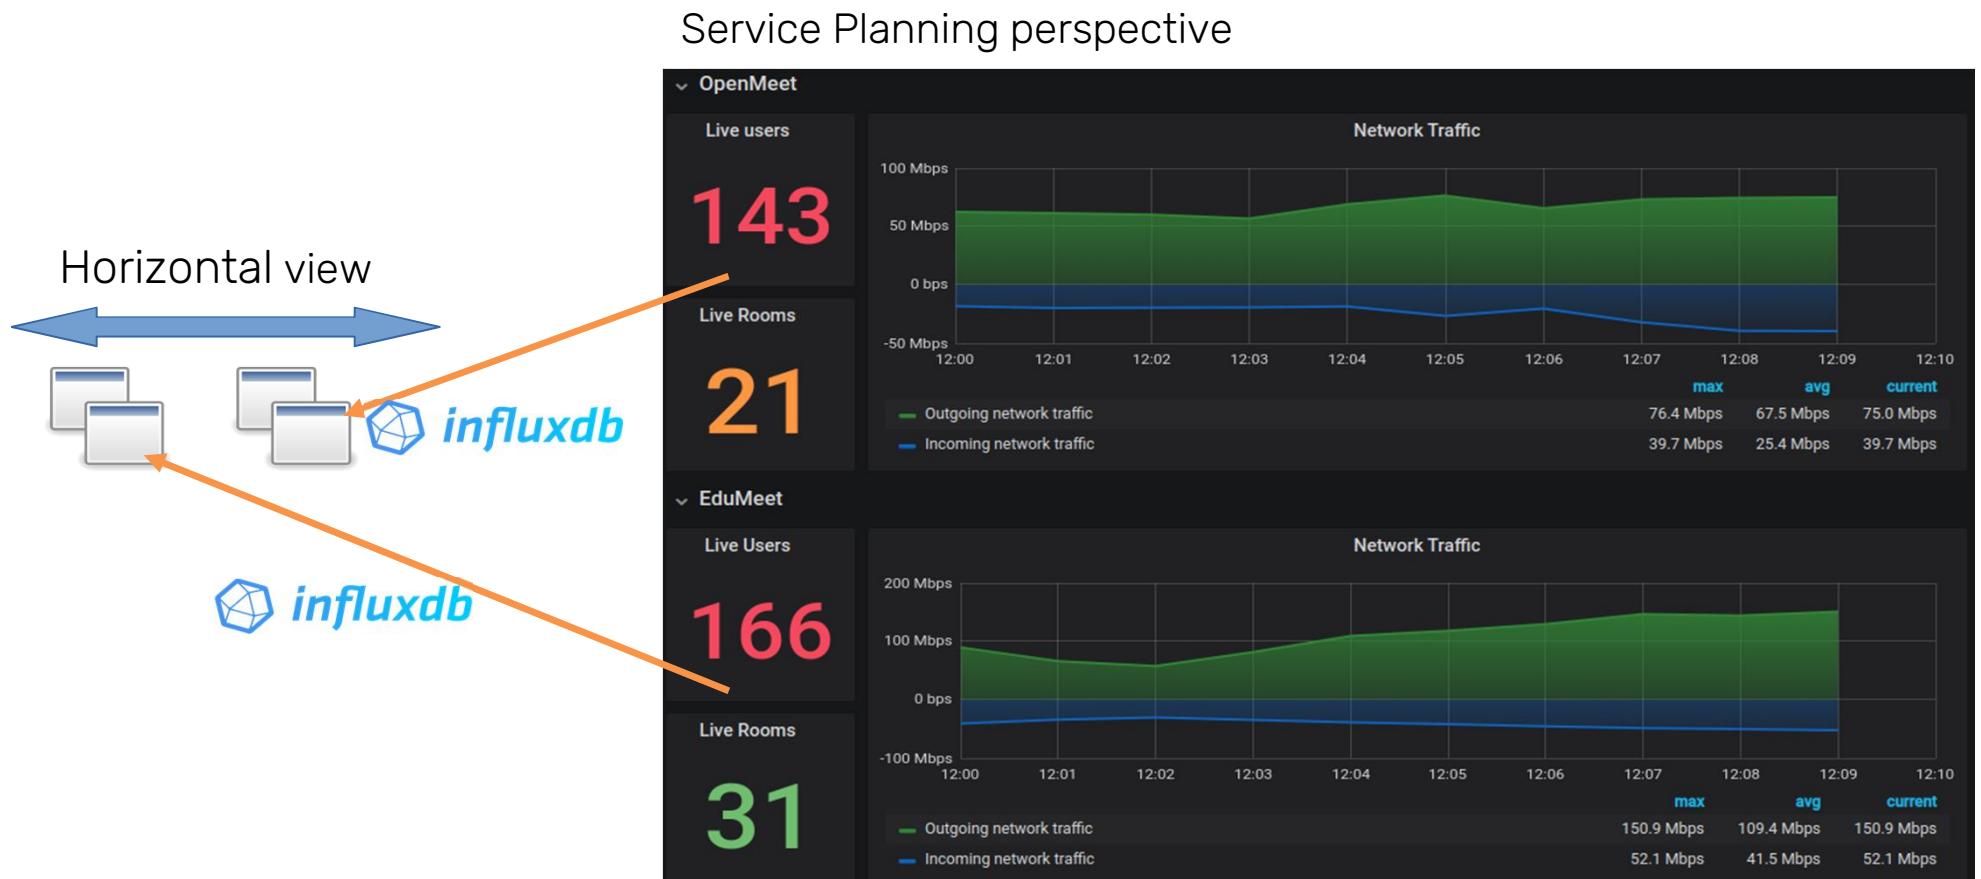

elasticsearch

Vertical view

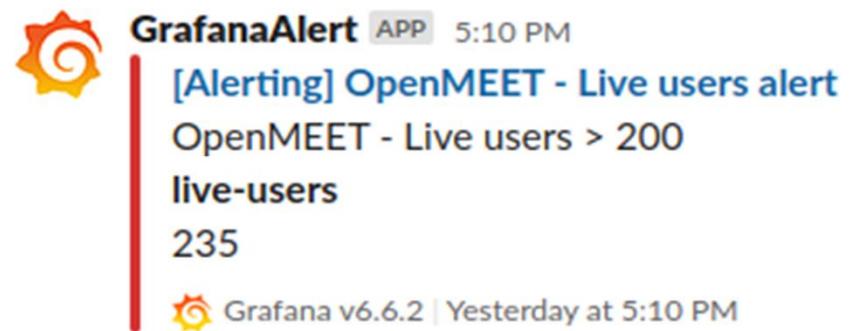

ZABBIX

# A horizontal view – Videoconference services

# Alerting and notification

- Operation paradigm shift
  - Hardware and software fault detection
  - Relevant service events as alerts
- Multi-channel notification
  - Minimal signal/noise ratio
  - Selective sending to the expert
  - Integration with collaboration tools (Slack channels, email)

# Conclusions

---

Long journey

- > standardized telemetry approach
- > methods and decisions first, then tools – but automation is a must-have
- > alerting, notification pave the path for the evolution

Next steps

- > application services log analysis (Kubernetes support, data filtering)
- > telemetry & log analysis convergence
- > smarter thresholds, richer analytics if/where needed
- > nudge the operations teams to Site Resilience Engineering
