

Identity Federations and eduGAIN

An identity federation (or just federation) is a collection of organizations that agree to interoperate under a certain rule set. This rule set typically consists of legal frameworks, policies and technical profiles and standards. It provides the necessary trust and security to exchange identity information to access services within the federation.

Some federations also distinguish the organisations that participate. Often there are federation members (e.g. universities and research institutes), which operate services and provide identities, and federation partners (e.g. commercial companies that offer services to higher education users), which

only operate services.

In the context of SAML-based federations, there are the following technical components:

- **Identity Provider (IdP):** The system component that authenticates a user (e.g. with username and passwords) and issues identity assertions on behalf of the user who wants to access a service protected by a Service Provider.
- **Service Provider (SP):** The system component that evaluates identity assertions from an Identity Provider and uses the information from the assertion for controlling access to protected services.
- **Discovery Service (DS):** The Discovery Service service, also known as "Where Are You From (WAYF)" service, lets the user choose his home institution from a list and then redirects the user to the login page of the selected institution for authentication.

National Identity Federations

As of 2017, most western countries operate one or more [identity federations](#)

for their higher education and research community. Most academic identity federations are operated within the borders of one single country. Thei

A list of current national federations can be found on the

[REFEDS web page](#)

and in greater detail on the

[REFEDS federations web page](#)

Other Types of Federations

There are also federations, which are not operated for members within a single national country but for members of a particular community. One of these is the [CLARIN Service Provider federation](#), which is operated by the language researchers of the international CLARIN research project.

There are also inter-federation services whose scope goes beyond that of a single country. Notably, the [Kalmar Union](#) (decommissioned in April 2017) and [eduGAIN](#). They are however not typical federations but rather inter-federation services, which means that they help interconnecting existing national federations.

How many academic identity federations are there?

To get an up-to-date answer for this question, please refer to the [REFEDS federations page](#). REFEDS is a group of

Research and
Education
FEDerations

operated mostly by a few National Research and Education Networks and the Internet Society.

eduGAIN - The

eduGAIN is a service that interconnects the participating identity federations. They agree on a set of common standards and policies which ensure interoperability. eduGAIN is therefore also called an inter-federation service. Its goal is to enable Pan-European Web Single Sign On (Web SSO) for members of the research and education community.

The eduGAIN inter-federation service is intended to enable

the trustworthy exchange of information related to identity, authentication and authorisation between the member federations. The eduGAIN service delivers this through co-ordinating elements of the federations' technical infrastructure and a policy framework controlling the exchange of this information.

More overview information can be found on www.edugain.org.
