

Inputs from External Testing

- **Android support is paramount**

The product is much less useful without Android support due to the very high market share of Android devices. Work is ongoing to secure a development contract to retrofit the required capabilities to the eduroam CAT Android app.

- **Proper support for UDP fragmentation required**

Some testers reported problems with Windows 10 devices (but not on other OSes). Windows does not limit the size of its EAP fragments while other supplicants do; so to make Windows machines authenticate, the entire RADIUS path (including SP network) needs to be able to handle UDP fragmentation.

- **Small bugs**

- Windows installer shows "EMAIL / WWW support" text even if not configured by the admin. Notified TW.
